

North American continental temperatures in PhanDA context

Stage-resolved published constraints are sparse in the Thanetian and substantially more numerous in the Ypresian

PhanDA stage-level surface-air temperature: median line, 16–84% dark ribbon, 5–95% light ribbon. Filled circles: screened BHB soil-carbonate T47; filled triangles: Kelson et al. Tornillo micrite T47; open symbols: published continental MAT estimates. Error definitions differ by source and are retained in the audit table. West et al. high-latitude sites reported only as late Paleocene to early Eocene are not assigned to either stage. West latitudes are modern geographic coordinates; other points use published paleolatitudes. Formation temperature and MAT are not equivalent targets.
