

BHB and Tornillo clumped temperatures in PhanDA context

Only BHB observations passing the current $\delta^{18}\text{O}_{\text{carb}} \geq 20$ per mil and $T_{47} \leq 50$ deg C screen are shown

PhanDA stage-level surface-air temperature: median line, 16–84% dark ribbon, 5–95% light ribbon. Circles: BHB soil-carbonate T_{47} ; triangles: Kelson et al. Tornillo micrite T_{47} . Error bars are ± 1 SE. Formation temperatures and surface-air temperatures need not represent the same season or reservoir.
